ENDURA INTRODUCES THE MULTI-FAMILY SILL

Greensboro, NC - April 17th, 2008 - Under the strain of the current construction industry Endura brings value to exterior door openings by adding components that surround door with an integrated system to keep weather at bay. Endura is proud to announce a component designed to fit the needs of multi-family projects. Endura's multi-family sill offers high value with great performance to work with the high volume, consistent construction practices of multi-family work sites.

Performance is demanded in multi-family construction because homeowners demand it. "Multi-family projects need a consistency from home to home. This consistency works very well with our new sill," says Endura's President, Bruce Procton. "We can be very efficient in our sill construction and offer an attractive price point in this highly competitive market."

The new multi-family sill offers many of the features and benefits of Endura's patented and widely recognized Z-Series sill, including an adjustable synthetic cap that will not warp from heat or stain from water exposure. Within the cap is Endura's sealed adjusting mechanism which allows the cap to be raised to fit with the door bottom or sweep. The adjusting hardware is protected so adjustments can be made throughout the life of the sill.

This multi-family sill also features a high dam design with an integrated seal to keep water out during high winds and driving rain. This high dam cap creates a barrier to water collecting on the sill deck. The integrated seal works with the high dam to guard against water traveling between the cap and the dam. The multi-family sill is available with a full or block wood substrate and has a continuous caulking surface along the length of the sill.

About Endura Products, Inc.

Endura Products, Inc. manufactures entry door component systems that improve door construction, door installation and long-term performance in the home. Endura components improve functionality, maximize the seal between the door and the opening, and reduce air and water infiltration.
